# StockAdvisor — Monthly Retrospective

Period: 2026-06

## Performance Summary

| Metric | Value |
|---|---|
| Total Realized P&L | $-194.00 |
| Portfolio Return | -3.88% |
| Win Rate | 20.0% |
| Total Trades | 5 |
| Winning Trades | 1 |
| Losing Trades | 4 |
| SPY Monthly Return | N/A |
| vs Benchmark | **UNDERPERFORMED SPY** |

## AI Pattern Analysis

June 2026 was a difficult month with a 20% win rate and a net loss of $194 on a $5,000 account (-3.88%), representing meaningful capital erosion. Of five trades, four were stopped out with losses ranging from 11.4% to 15.2%, while only one trade (DFTX) hit its profit target at +18.6%. Critically, SNDK also triggered a profit target exit at +6.4% but with zero shares executed, suggesting a position-sizing or order execution bug that cost the strategy a realized gain — this is a significant operational issue that must be investigated and fixed immediately. The most damaging structural problem is the mismatch between stop-loss depth and profit target levels relative to position sizing. UUUU was the largest position by far (60 shares, ~$998 notional) and also the largest dollar loser at -$113.83. Meanwhile, the only meaningful winner (DFTX) had just $43 in exposure. This inverse relationship between conviction/sizing and outcome is a hallmark of poorly calibrated position sizing — either risk per trade must be equalized across all positions, or larger positions must only be taken when the probability of success is demonstrably higher. Timing of losses points to a late-June cluster event. Both BE and TSEM stopped out within one second of each other on June 26, and UUUU stopped out two days earlier on June 24. This three-day window of concentrated losses suggests a macro headwind — potentially a risk-off move driven by geopolitical, Fed policy, or sector-specific news — hit the portfolio's correlated holdings simultaneously. BE (clean energy/fuel cells), TSEM (foundry semiconductors), and UUUU (uranium) all carry some sensitivity to energy policy and industrial capex sentiment, creating hidden correlation that the portfolio construction did not account for. Stop-loss levels of 11–15% are appropriate for volatile small/mid-cap names in isolation, but they require a win rate well above 40% and average winners exceeding 20% to be profitable over time. With a 20% win rate and an average winner of approximately 12.5% (blending the DFTX gain and the missed SNDK gain), the math does not work. The strategy needs either tighter stops (5–8%) to reduce per-trade dollar risk, a higher-quality entry filter to improve win rate, or a deliberate move toward asymmetric setups where profit targets are set at 2–3x the stop distance. The primary actionable recommendations for July are: (1) fix the SNDK zero-quantity execution bug before any new trades are placed; (2) normalize position sizing so no single trade risks more than 1–2% of the portfolio ($50–$100 max loss per trade); (3) review entry criteria to determine whether signals are being triggered too early in a move (chasing) or in the wrong market-regime context; and (4) consider adding a simple market-regime filter (e.g., SPY above/below 50-day MA, or VIX threshold) to avoid entering new long positions during elevated volatility or downtrending market conditions, which may explain the June drawdown cluster.

## Strategy Update

Strategy performing at or above SPY benchmark. No changes made.

## Transaction Log

| Symbol | Action | Price | Qty | Amount | P&L | Date |
|---|---|---|---|---|---|---|
| BE | SELL | $279.05 | 1 | $279.05 | $-49.86 | 2026-06-26 |
| TSEM | SELL | $247.24 | 1 | $247.24 | $-37.14 | 2026-06-26 |
| SNDK | SELL | $2318.99 | 0 | $0.00 | $0.00 | 2026-06-22 |
| UUUU | SELL | $14.74 | 60 | $884.57 | $-113.83 | 2026-06-24 |
| DFTX | SELL | $43.51 | 1 | $43.51 | $6.83 | 2026-06-24 |
